

DAO Call November 3rd transcript

- Okay, today is November 3rd uh members here are splottingham, Bree, Rodd E., David, myself, Rochelle. Bree is trying to work out her audio as we speak so I'll go ahead and get it started. I know she can hear me, she just can't speak. So I think maybe until she gets that fixed, maybe she could like type out stuff in the DAO weekly call channel and then we'll see,

and I can document that in the call as well till we get this figured out.

That makes sense, so today let me

pop out the call window for me here.

Oh shoot, no i don't want it in this stage. Okay, there we go. On today's agenda she has...

There's no new proposals at this time and the

hackathon proposal is processing and it looks like it's going to go ahead. um oh yeah for sure pancake swap one it's being funded that was a yes um she has questions and discussions for with the team um they want to know a little bit of an update about the sdk and you're the most perfect person to give a little update yeah yeah i can't talk about that actually um i would love to is it working hey hi yeah hi oh my goodness i forget this i was last week it was the computer i had problems with this week it was my phone i'm having problems with

oh okay dogs

okay hi bri hi i'm david um i'm part of the team nice to meet you guys nice to meet you too stop barking toby oh yeah really nice to meet you okay yeah a team member not rochelle i knew

the red web summit and they're doing meetings and you know like yeah so i think they're also like pretty busy at the moment yeah which is which is a good thing so i'm not gonna stop it from those meetings yeah exactly exactly um but yeah like about the sdk um yeah i would love to talk about that so like we've made a lot of progress in the last couple couple of weeks and now it's we've come to the point where we have a usable sdk but we've noticed that it's not very friendly to use so these past this past week we've been doing a refactoring of it in order to make it as simple as possible for the hackathon that people can easily imported and they only need to call them a couple of methods in order to instantiate

the client in order for them to start creating campaigns and submitting tasks to their respective campaigns um so we have an actual working prototype at the moment and um the idea is that it's gonna be finished by friday um and

that it'll be done for the hackathon like it's it's definitely gonna be done by friday um the only thing that we're a bit worried about is then um yeah unforeseen bugs but like um we've all made sure that we we made time to be available and in order to support developers during the hackathon for any bug reports that do come up um but yeah like i there was talk about like open sourcing it but like it's it wasn't it wasn't completely there yet but yeah so it it supports both um the eos blockchain and the binance blockchain um campaign creation is supported one major feature that we're missing at the moment is qualifications um but we're also i'm working on that prototyping that and it's not a of a necessary feature for the hackathon but we do want it in the hackathon because it is a necessary feature just for the platform in general and what else um you have a broader wallet feature so you don't necessarily need um an eos account or a binance private key in order to interact with the sdk to do basic functionality but if you do want to do

if you do want to have all the functionality then you do need to have an eos account or a binance um private key um

i think that's that's about it like are there any questions like am i missing anything obvious

that mean what about you so to be honest i would just like to see it that's really all i can say about it i would like to see it because they say it's not uh too user-friendly and i can't really give an opinion on how user-friendly it is or any suggestions i would i would make uh without seeing it um but they sell they'll be working on uh by friday so yeah just gotta trust them okay yeah um well this yeah so like we're also working on a quick start guide and like it should be um up by the end of the days and like you'll be able to i can invite you splattingham to let you take a look at it like i would love to get your feedback on it oh please i'll send you a direct message uh after after the call okay okay we'll do we'll do but yeah um yeah we're just gonna notice like um ourselves as well that it was

the flow of in which we needed to um call certain methods and like create um the object instances just it didn't really make sense and we we really wanted to refine that like and pack it into one simple to use function for developers javascript right um typescript right well yeah yeah yeah yeah basically javascript yeah yeah cool so i'll better give a pretty decent uh overview or feedback of it i just knew that uh well previously talking to jesse he said that like javascript wasn't really his language of choice to say the least uh yeah so yeah that's right anything i can help with like oh i'll be happy happy too okay yeah that's the the main thing that we're kind of worried about at the moment of um

how well other people will understand

the flow of it so just to before we not to get into too much of a technical lesson so the last thing i'll say is i'll i would take as much inspiration as possible from the stripe development team when it comes to their apis and the way that they document things quite possibly the uh most just well-engineered uh sdk that i've ever played with and the dogs to go along with them they come with tons of examples and tons of uh tutorials so i would take a lot of inspiration from from stripe and and and use it that way yeah yeah that's a good point like i also really love their docs like i've also like tried to use that as like a point of reference of you know like where we can be um someday like we're definitely not there yet we're very far from ever getting to that point but yeah it is like a bar from which we can kind of compare ourselves to like and hopefully we can achieve that kind of quality one day is there anyone on a team who's like a javascript uh aficionado like you know yeah yeah yeah for sure like so we do have lawrence which is pretty good and um the other developer that we have on our team right now jair they're pretty good at javascript so um yeah and yeah jesse is more into languages that are a bit more obscure and not very um widely known so he's a great programmer but he's just not like he's not an aficionado of like he's a bit of a programmer hipster let's say um but my point was that like we are using diffuse and eos.js as our point of reference and we are kind of modeling their um libraries in the way that we create our creating hours right um and defuse has been a tremendous team they got um grant funding from the canadian government and the graph um two months ago and um they have a very technical team and i do think that their um projects are worth emulating right uh i just did a quick search of them i've never heard of them but uh i'm sure it's good

um but yeah yeah um but it's a good point like um i did hear and jesse mentioned something about like open sourcing the sdk finally like it's been a long time coming um and i think we're almost there

yeah i'm gonna be modeling some of my documentation i write up for the hackathon

they also make like pretty frequent youtube videos going over different parts of their platform

on our youtube even if it's just me going through walking requesters through how to do things

yeah yeah that would be great

we don't have enough youtube videos

yeah but like that's also the thing right now like um we are trying to target a more a developer audience and yeah we have very little content um for developers at the moment and i do think we also need to start um being more aware of that and producing more content for um developers and making ourselves more attractive to developers instead of only workers or or requesters

i'm going to make some youtube tutorials how to use the effect sdk when you're not a programmer

uh

i i would yeah i was talking with mark yesterday

we need a lot of um one-on-one sort of courses you know yeah no but ideally like um anybody should be able to get up and started like with sdk just like copy and pasting some code and then seeing their results on the force

yeah it would be really lovely for people who don't have the first clue about code to be able to put something up on the course yeah agreed yeah but also enough information that someone like femi can just like get at her right away

yeah um

the hope is that um it is built in such a way and that we can inspire enough people or inspire enough use cases um for the hackathon for whom people can develop original ideas and how to use the platform so like of so that they can develop use cases that we haven't thought about yet and um that they can really take off with it on their own and use the sdk for their very specific

requirements well it's coming it'd be nice if it was done already but you know that's the impatience of people but it's coming so long as it's good for the first hackathon that's what really counts right now right yeah yeah yeah we all we already wanted to like be out and about so like when people start signing up for the hackathon this week um they can already start looking at our documentation um apparently there have been um some friction with getting um our account registered on death post um so it was supposed to happen today but there was something something that happened so it might be postponed until tomorrow or until friday

DAO Call November 3rd transcript

but the idea is that when that death post um account does go live that like all of the documentation will be online as well right away with the announcement of the hackathon

okay

we made an account but they have to activate it so we can list the hackathon so we're just waiting on the people at dev post to do it um so then we can just start and putting all the info about

built

um

i i haven't heard anything officially from jesse or lawrence or chris and so um i don't know like uh

i don't know to be honest you know what i think that's tomorrow they're gonna say something yes

yes you do so we don't get an early glimpse of it here do we um

chris will be speaking on the kickoff um lawrence will have a um an event he's gonna host and talk on and jesse has an event and talk he's gonna host and then i'm at the end i'll have an event i'm going to talk and host

so it's going to be what on four different days one of us is going to be having a event with speaking about a particular topic

is this a topic we can get hyped about uh yeah yeah and anybody will be able to see that these um even if they're you know not in the hackathon

so yeah

the whole schedule i know will be released tomorrow with the ama um and the ama is going to be during web summit which is pretty cool um so yes and and the questions i collected from the telegram uh ama channel will be will be in there um and then a whole bunch more information and about it and rochelle are you doing your magic to make sure the questions are answered well um i gave them them it shouldn't be hard because this isn't like those old things this is all about hackathon and most of the questions i saw were were really good and they actually all of them were really good questions and um it's all the info that they're going to be releasing tomorrow anyway so i think everyone will be will be pretty pretty happy good

good

okay um any more on that no i'm getting an echo i also noticed that the repo for the sdk is already public so i'll share the link

it's not a bad thing to be busy with

um okay so any more on the sdk or uh hackathon

any questions for me

i think that was a pretty good coverage so really by friday we're we're looking at having a nice decent product it's not a perfect product

sorry what what'd you say by friday we're looking at having a decent product for release if not a perfect one for the sdk right yeah that's right okay um a working prototype that um

that will be suitable for the hackathon okay and the user friendly for dummies is still to come um like it should be user friendly as well like by that point um

we also have that like um not only developers will be working with it but also designers and such

okay that sounds good

all right so i've added a few things to my agenda since i posted last night it's just some things i was thinking about half falling asleep um

so i know chris has answered this several times but i still think it's really important um to have a token flow map of some kind or a minimum an update to the token map that's on the dao um website

um so i just want to put that on the agenda again and sort of not drop it entirely um i don't think that's something either you david or rochelle can address so the next no i'm sorry i i don't know no i don't think that's a it's really i don't even know who's i know chris is struggling with that one or doesn't want to or is just like let's move past this one but i don't i still think it's important in some way so anyway we just i just put it back on the agenda for further discussion that's all um so when i post the i'll talk about that bit later okay um also there's a couple of community members in telegram who would like to apply for being a community mn like in the same way that jahuda is but they're both on the north american or south american time zone um and i think that would be a good idea

um rochelle i can send you their names privately just because i don't remember it right now i have to look it up that'll work yeah and i think the one guy anyway i think he would be a good bit from what i've seen of him so far on tg

we've needed somebody in this time zone for a really long time and rochelle has stepped up but honestly it shouldn't be her she's got many other jobs that need done she shouldn't be monitoring tg there are other people who could be doing that yeah exactly exactly and also rochelle's time she might be on the in this continent but her time lifetime is not it's more like with you european guys i mean somebody with the time of as north american south american yeah that's a good point that's a good point so anyway i'll forward rochelle those things to you

yeah i mean like at night it's it's it's like manfred and myself and a couple others like even rochelle sleeping nope well you should be sleeping let's put it that way like i'm pacific time like i'm one of the last ones to go to sleep here you know i saw when you posted the down notes this morning

well i was up too late last night actually

that was last night for me it's always i always post them right before i go to bed and then you guys have all day to look at them but now it's a good idea so yeah if you can just private message me

yeah we need somebody who can delete things right away or who can maybe approve and share a link that's not been whitelisted or something like that right like who can just engage somebody who's willing to make a post on twitter and then go on to the website and say hey guys let's give this some love but they've got some kind of official tag next to their name right this is hard you can't like really do it too much but yeah we can we can something where they see that they're an admin i i see it in other groups so it must be able to be done like you've got community admin and then you've got mod and a mod is not doesn't have all the privileges of a full community admin then you've got tags that identify the team right so it's got to be able to be done

and we need a few more mods if not community admins but we really could use with that north american south american time zoned um another community admin like jahuda and maybe a few mods like maybe manfred um and myself could have mod attached to their name it's just to show new community members people they can trust right

yeah maybe alex too could have more beside his name because he's really good at getting those technical questions answered

right um so you know some of the more the more prominent um in there all the time really sensible people you could look at giving them mod status but i think we do need another community admin opposite yehuda is it getting overwhelming at the moment with those particular time zones no not right now but it can do it comes in waves depending on the price and and depending on what chris has been doing for getting people to get interested right yeah but it's like a shoe box we had an interesting week when the youtube started talking about us because boy did we have

um and you get i don't know just you've got some really good solid die hards that just won't go away because they just believe in this project so much and they've been around for three years or two years or one year and they're the new enthusiastic positive um it won't hurt to give some of these guys just modern status just to show the new ones who are popping in who they can trust and when the hackathon happens too i see more people coming hopefully yeah so like alex would be a really good one for new developers may be popping in but this is like a shoebox right it only fits so many until they're just not like how many comments there's a lot of comments it's like are there any admins around like

i don't know i just we need a little bit more of an official or a trust presence yeah especially to handle the volume when it comes and we can't predict when it comes and when it does come it can come heavy and hard yeah and to really try to moderate the community and like um to make sure that yeah all of the scammers exactly i've seen um

in other groups the bigger the numbers they are the more of those mods they have and they'll state you know in the rules that the mods aren't are just there to help and guide they're not they're they're not like controlling events right they're just volunteers

okay so enough on that um but we'll move on from there that's all i really thought about for the team discussion right now part of it is they're they're all focused on price right now so it's okay

got the pro tas and the the antag tas because it's too low cap that's quite funny reading them all but it's nice to see the ta channel being so active

okay um i don't know i think it seems to like looking at liquidity right it seems to me that um the uh pancake swap farm is doing all right and there's been some more added to the orn um orion protocol

pool there somebody's added a nice note to that

um i'm not that's not really my area of topic that's usually uh jesse and alex to talk about liquidity stuff you know like it has been um slowly but surely it has been um it's been used more and more often and um also the fees that are returned from the liquidity pool have also been increasing slow steadily but surely um the last um fee we collected was over a month's two cycles i think and it was 50 000 efx and um we've also noticed that that's been the main driver or there have been moments where the pancake swap has been where the most volume has been happening so it's i think or we consider it to be like a pretty big success up until now that people are using pancakes who have to um get their efx instead of going to cue coins for example um but yes that's why we also we want to keep growing it and like um slowly but surely give it more funds for it to um handle for us

yeah i i think it's been a good thing too from what i've been seeing so i i know this this period for the farm has been extended so it's much longer but if this keeps going at this rate slow but steady um we're probably looking at another period for the firm oh yeah definitely definitely um i think that will be the case as well yeah and i don't as long as the foundation keeps matching the dao i don't see any issue with that going through yeah yeah good point

cool okay uh what's next we talked about that i guard nothing right now okay um for open discussion i don't remember what i put on your this is where i added a few things i was working on a drawer a job board for the community so i created this in gitbook um did i put that in the agenda already with the link yeah you did i'm looking at it right now yeah so um i was talking with mark last night too while i was writing all this up um just about creating nfgs and how he's getting together with some friends and and so this is where we can post our our requests right so i have an app idea say my little robot drawing i did

right and i want to turn it into an nft but i don't have a clue how to do it i can say looking for a developer to uh turn this robot into a a series of nfts or whatever right like so i can put that in and we can arrange our collaboration together or i can just pay somebody straight out to do it

and or whatever these little jobs are that we need help with or we have an idea but i'm not a designer say i'm just a developer and i need a designer so i can put a little shout out in there needing help with something and i also put all the little step-by-step um guides that i need written up if i do a guide myself i'll take it off or i'll put a comment on that i'm working on it but at least there um other people might be able to help so i'm gonna start promoting that page soon in telegram and then um discord because it's really an in-house for the community yeah so like for example like you would make a proposal and like with that proposal

you would then like

using this job board like you would like try to get the funds for example to get that job done like yeah am i understanding that correctly yeah yeah so uh let's say i decide to take on three of those step-by-step guides and illustrate them well it looks really simple but honestly it takes so much time to do screenshots and make sure you're not screenshotting anything important that shouldn't be screenshoted you know and show them step by step or having to create a fake account to go through all those screenshots that show illustrate that all takes time right yeah it does it does and it takes a few dollars to set up an uh fake account right things like that right so yeah put in your proposal on your either projected expenses or get the job done and then put a proposal to get reimbursed but there's no expectation that these are done for free these are tasks that are necessary for the community to

ease or right and as far as developers and and getting um help with little pieces that you don't have the skills for the whole idea is that this benefits the network right yeah yeah i've also noticed that like we lack property document and community documentation and um it's really great to see like that um all of you have been busy like trying to make that documentation happen and but yeah i can still see that we're still lacking a little bit in that department yeah so everyone has their skills and talents this is what i've learned over the last little while everyone's making talents and the team's talents like the core team doesn't really include those little pieces of documentation that make things just so much easier for everyone else and they've got strengths but that's just not one of them and communication is another one where needs to be upped and whether that means hiring somebody else or whether that means the community steps up or whether it doesn't matter it needs done somebody's got to get on it so what there are two goals that i had getting really involved with these calls and one was increasing documentation and alex had that same goal and the second one was increasing communication between the team and the community and we're working on it and it's improving but we're not there fully yet right but and rochelle is super stepped up too

the more documentation we can get the better

yeah absolutely we all have busy lives too so it's hard to say like for me sometimes i can work really well and get lots done and then i can go weeks with struggling to get anything done yeah no like i really love like um that this is being done and the way it's being done and like to see that there is interest like outside in the community as well like um to help other community members um get this done and um i also feel like it should also be represented a bit more officially um and not only through like a getbook.io um link but through a proper effect network link as well yeah that would be nice yeah to give some proper um representation

and acknowledgement of the community work that is being done cool yeah that's not even been brought up before

yeah but it's always nice to be acknowledged for the labor that is being done yeah nice okay um

that was kind of a nice segue into what where's my agenda there okay um

yeah so i have not been able to write any notes like i've really really struggled to write notes and i just i don't know what's going on with me but i i can't do it so i've been toying with how to solve this problem

um so what i did for october 27th was i posted the agenda instead of written up notes and in the agenda i embedded a youtube video of the audio so i created a youtube video from michelle's recordings and then i've got the transcript the auto transcript from the youtube video that i just copied and pasted into a document and then i embedded the file of that document into the agenda so the the audio the transcript and the agenda are all one document in get book and i'll see how that works and i have to say the automated english transcript from youtube is the most god-awful thing i've ever seen in my entire life

but i looked at having effect force

transcribed properly and it was going to cost 116 dollars for that one meeting and it wasn't the longest meeting we've had so i'm not sure that's feasible to spend a hundred dollars every single week to get them transcribed so uh the auto generation will maybe help those who who would rather read it and skim through quickly than watch videos but it's not very accurate

maybe if i've got time i'll try and clean them up a little bit but so that's that's that that's my current solution

that sounds fine like um are there a lot of people that um have been requesting to reach transcripts well the summary notes and the audio yet i know there are people reading them and i know there are some that prefer the text and some that prefer the audio yeah yeah and it just really is your learning style right yeah um and so it's not um but i'm guessing it's also like some um in the trend of accessibility okay yeah i know um like one of the guys have been privately sending him the audio because he's well maybe he's in discord now but he was having trouble getting into the audio files and discord so i i started downloading them and just sharing them privately but um yeah i like i would rather myself if i'm driving i like to listen to the audio but if i'm not driving i would much rather just skim through some text um yeah yeah yeah that way you can cover more ground more easily yeah so it's really just trying to create um different formats that people can access like yeah accessibility right

you can't have it all audio in case the person's hard of hearing right yeah exactly exactly um but yeah i do think your solution works well for now and um

the technology of transcribing is also getting better and better and like or if it doesn't get there like on time for to keep up with the way that the community is growing then it might be worthwhile looking into like trying to get it onto the force in order to properly properly transcribe them yeah yeah yeah um one you know i can sit down when i'm really bored one night and just um for reformat the like it's 25 pages of transcript copy paste and it's choppy every time the speaker takes a breath or a pause it goes to a new line so it's not even like a whole line across the page it's just it's it's probably only about four pages worth of text

but right now is is all i can provide i just don't have it in me to do the notes right now the way i considered them properly done yeah yeah um so it's better than nothing indeed indeed and yeah maybe we'll get busy enough they'll be worthwhile that 116 dollars you know i mean hopefully hopefully like uh i i do think eventually we'll get there um absolutely but yeah

i'm not sure if it's if we're there yet but no no i can't justify it in my head

not yet um i just know it's really important to have written documentation so right now this will have to do

okay um hi alex nice to see you yeah sorry i'll have a good reason i just kind of overslept a bit

i'm not i made it like five hours sleep here

okay so it's good to have you you missed all the good talk on the sdk

sdk it's it's been public published for now like the prototype anyways i have to check it out

yeah um i only have about one other thing i put on the agenda and that was just to start thinking about um how effect dao could end up becoming or even now when when we're voting um yeah i'm glad you're here alex for this just put a bug in in you guys's ear to start thinking about how to avoid oligarchy type top heavy voting and are there ways that we can create a space the top voters maybe i don't think it's fair to take away any vote weight because they've been able to contribute more but perhaps there's a way we can get lower amounting community members to be able to lobby or present ideas to the top voters for consideration in their vote so some kind of system where it's um

creating more communication between top weights and lower lower weights and i'm not i don't have any idea formed i just i know the guys who have lots of money it part or not money but lots of tokens at the top um they've put in their time and their it's it's the value they're able to put in and we shouldn't take away from that but there's a lot of fear of it becoming like it's their way or the highway whether we like it or not so i think there needs to be some kind of communication freeway if you will i suppose between between them so that it feels really community community decision and and all ideas are listened to and considered and the damn the dow calls like that too but obviously it's not attracting everybody in part of that time zone but um i don't know just putting it out there and ace isn't here but it was a concern he had also has the issue been worse since the implementation of the proposal to eliminate the i was thinking about that in a way yes in a way because when you had to have the 10k minimum

you you had some weight behind you to begin with but when you go in and you've got 10 effs and that is your weight it really it feels like your weight has no impact your your vote has no impact doesn't matter what you say so i just feel like those those ones who are just coming in need to have a real clear sense that they can be heard

and maybe that's pre-vote or maybe that's a space where they and this would have to be official right not on the community github i think this would have to be on the dallas place summer where they can leave their thoughts prior to the vote i um like i don't know like i'm i don't have any real fix ideas i just want us to start thinking about this yeah but that was also one of the reasons why we have the dow proposals um channel um on the server right and that people can discuss with each other about like um

what's happening and um in a way try to get everybody on the same page and like it's not about like who has the most vote weight but like in order to try to cultivate a sense of like what's the right thing to vote on but yeah maybe i'm just being way too optimistic as well or idealistic about like how other people will behave in this system yeah well i right now i don't have any fear of the people with the bigger holdings um because my senses they're all on board with what's best for a fat network i don't pick up anything malicious from anybody so it's not really me that's feeling this way and i'm kind of a middle ground person i'm not a low holder i'm not a high holder and i i feel balanced i you know i don't feel anybody's off balance with helping out the effect network but as we get busier that could start changing and that's where the the fear thoughts are started creeping in i think from the more middle ground people and the lower people are mostly newer people or maybe a worker who's just yay now i can enter and have a voice in the boat right somebody's not or or new people who are just starting out and maybe discords there's a lot of people who don't like discord because it's unfamiliar and i'll tell you it wasn't easy to figure discord out i've got it now but it took a while yeah so it's more of an issue of trying to engage newer members instead of yeah actors um sabotaging the tao that's what i feel it's like we've got to find a way to get those new people who aren't familiar to get to know those big holders to know that they're listening to them yeah that makes sense it does but then for example changing the dynamics of the tao is is for me like i would think that there are other mechanisms that we can employ in order to engage and we're members um to participate in the now instead of changing the dynamics of the tao i i don't think we have to change the dynamics i well maybe other people are thinking that but i'm thinking that we just need to find a mechanism to get new people who are unfamiliar a really easy access point so they really feel that they're hurt yeah even if their vote weight doesn't carry a lot at least they might feel like um you know they actually had a little discussion with alex or with richard in in a format way right yeah like was maybe like implementing the basic dow features into the effect force itself that way when people are on the platform that they can access that via their dashboard for example and it does all of those um volume proposals for example can happen through their own like personal dashboard interface instead of going through um the tower front end because now it is it kind of feels like its own standalone thing and that can lead to like not enough people participating yeah the more engagement or ways to get people involved and engaged and um yeah there's a link in the profile section on the workers i don't know like i know they're they're separate entities but they're also connected right yeah yeah yeah exactly

so even just links and stuff yeah so anyway i just wanted to get that out there because it's been a topic that's come up more than just this week like it's been a few weeks i've heard this sort of creep in and not just one person

and you know where people feel like they're not being represented yeah yeah they they fear

what whatever the fear is you know they fear the bad actors at the top i don't see that happening especially with the people we have there now but i think where they were think if we look at it

exactly yeah exactly exactly that's exactly it but if we look at it from where the fear is coming from rather than trying to change the structure if we can just do something that might alleviate some of that fear

yeah we know that you know that alex knows that like we know that but the new people coming in like just one more layer where they can communicate and and maybe not brand new people coming in because brand new people it might be too much for them but like the guys have been for three months or something are feeling like they they're just never going to get their voice heard really my opinion is that we've made place channels for people to discuss the proposals and whatnot there's a lot of introverted people who don't want to interact but they observe everything yeah this is very true we've done everything i think that we can to provide avenues for people to interact so that it might be a matter of making those avenues more known

like i i don't i don't know i'm just putting it out there okay don't shoot the messenger here

just if the avenues already exist then how do we get them where people are using them or if we can jump away to you know just link the discord um discussion page for proposal on the proposal page after so let's do that

after the proposal is done it it pulls from that website so

i don't know if it can be edited after the fact yeah i'm thinking they may want need like some sort of update where you can have like uh

post uh a discord link or something like you know how you can edit your proposal before it's published but you can edit like some sort of like extra information after it's published it doesn't change the content of the proposal but allows people to like have a link available i don't know yeah i think that's a good idea actually um just like how we introduced like the comment section like and then have indeed just one extra property field that yeah would just like be the link yes to the discord i think that's a fantastic idea and also a good way to incentivize more people to join the discord

i think also for the links we may wanna because right now the way we do it is you have to click it but i think you should just automatically load it and it will be like displayed below the user so that way you can just see all the comments right away you don't have to click them out you can kind of get tedious if you want to read every single comment yeah

okay okay um that's a good point like um uh i'll take that into consideration and like put it to the deaf team so that like we can work on it and find a better implementation

um could we also make the comment section more like when you when you cast your vote there's the comment but you have to toggle it on do we have to have it toggleable like can we just not have that comment section permanently there visible instead of having to toggle it um

maybe um i think so but i'll have to take a look at it and um check with the person who built it like to see if that's um a reasonable thing to be done yeah and the the only reason i'm i'm saying that is just to make it really in your face that you can leave a comment

and instead of like half the time i don't even see that the text is too small for me my eyes are getting old you know okay like that yeah um yeah i think that should be doable yeah um yeah like um yeah i'll ask the person who made it like what their intentions were and um pitch it to them and see if they're open to um making it more accessible okay

all right oh i see and andre's there

um all right i don't think i had anything else let me check i was thinking of adding in the ad and end them um to the hackathon i think we talked about this in the chat before how i think it was like an issue rochelle mentioned like and it's kind of related to the subject that the since the dow votes kind of because as people call it oligarchical though i don't think that can really be changed we could add like um another voting category for the workers because i remember we discussed you know these nft competitions where they kind of drill down and choose their favorite nft i wonder if they can just use the same process for choosing down their favorite project

for the hackathon yeah for the hackathon yeah we've also been trying to think about like mechanisms that we can use um in order to um get the dow to be also able to vote on hackathon projects um

we're probably thinking about like it might be a proposal um that we'll submit um but we also want to engage the dow and voting on their favorite hackathon

the workforce

so like it's a an extra another set of prize like that so like it would be like basically be like a sentiment proposal where the dow votes whether we should you know because we're kind of limiting how much effects we're withdrawing but i mean we can still withdraw more and then i think we can do that extra amount to be like a prize pool that the workers choose which project and that way like there would be more participation i guess from the worker side yeah yeah that's a good idea actually um there are pretty big audience that like we should engage as well and um it's we're building this for the workers so yeah like yeah we

i don't i don't i don't remember and any conversations happening about that but it could be that like jesse lawrence or chris or the rest of the team have talked about it um but yeah i'll ask them um see if we can think of something in order to engage the workers as well to vote on hackathon projects yeah jesse and i had a discussion about it when we were working on the setup with the prize pool because we have to like list it a certain way in dev post you know um

and so we're trying to figure out like the split for it and then two we're also wondering what if one project just ends up winning in all of the votes for the different things you know so we we had we had quite a discussion on on setting it up um it was jessie and i and velika and um the guy from devpost itself so um i think that's that's part of why i'm assuming there's just a little bit of a pause with setting up the account is because they just want to make sure it's like really clear and fair on their platform about it so but that should be resolved today um but yeah there's gonna be lots of there's going to be stuff for workers who are participating as well i'll be i'll be mostly handling the the workers on the test environment side um that will be doing the tasks for the hackathon project

that the dao is definitely gonna vote as well yeah i was thinking that in just a new prize pool so it doesn't necessarily need to be like on death post i guess if it kind of makes things too complicated because i think as long as basically when we uh advertise we're going to give away this amount of money we have to give away that amount you know whether we promise effects or dollars but if we you know as the dow decides to add on to that and maybe add more prizes i don't think anyone will complain about that

yeah i'll know more i'll know more at the end of the next two days um with jesse when we get everything in the platform for that

yeah i'll just make a sentiment proposal to see if the rest of that wants you know add on another prize pool because it is like you know spending a lot of effects so we'll see

i think maybe after we have the ama people be more

DAO Call November 3rd transcript

in the noah with the details and stuff

and i'm sure some good ideas will come after after that info is revealed that we can incorporate

it sounds good

anything you want to talk about um andre

not really thanks hi hi anything else alex

i think i cover what i wanted to okay send me anything else for you

nope just waiting for the sdk whoa yeah waiting for this to go

bits and needles thanks i'm waiting for the day that you are you're able to manage to get everyone paid in perpetuity

we need to be the the owners of said ai well then let's be owners of said ai what can we do

yeah okay

all right developers all this pressure on you

okay i think i've got nothing else i'm done all right then i'll see you all next week all right thank you david very great having you here yeah it was nice it was a nice call it was nice to be here excellent david joy yeah no that was really awesome

a different perspective too yeah absolutely i i'm usually a fly on the wall like uh hearing jesse during the meetings but like it's nice to be able to participate as well like for once instead of just being a fly on the wall well you know you're welcome any time you don't have to wait till jesse's not available that's a good point did you read his latest blog post she posted a blog

david or jessie

no we're so kind like it's it was just a little blog post about like how people can host on the bridge themselves and so to kind of like cultivate the idea that you know it doesn't have to happen to our interface like you can do it on your own computer as well

huh i wonder if i read that but i've had so much in my head lately yeah it's on medium if you want to hard for me to believe that i missed a medium post though

so i might have read it and i'm just in and out because it's not

yeah yeah

was that like just recently yeah yeah last week well i must have read it well you know there's a reason i'm not getting the notes done either right like that's so much going on are you still recording michelle um yeah are we ready yeah we're done we're just chatting now
